

WHAT IF THE TICKET SYSTEM COULDN'T CRASH?

Rush-proof Event Ticketing

FastAPI + Redis • Built for the moment everything goes crazy.

Srey Jaiswal | The Deconstructors

WHEN DEMAND EXPLODES, TICKETING BREAKS

The system isn't tested by normal traffic. It's tested by the moment everyone clicks BUY.

01 SERVER CRASH

Massive concurrent traffic overwhelms traditional database paths.

02 SCALPER BOTS

Automated buyers consume inventory before real fans get a chance.

03 STUCK INVENTORY

Unpaid reservations keep valuable tickets unavailable.

04 QR FRAUD

Screenshots and duplicated codes threaten the gate.

THE REAL CHALLENGE: **SURVIVE THE RUSH.**

BUILT FOR THE RUSH

A FastAPI front end with Redis handling the critical, real-time ticket operations.

EVERY ATTACK BECOMES A PROTECTED USER

Technical decisions become measurable trust for fans, organizers, and venue teams.

TRADITIONAL		RUSH-PROOF
Database bottlenecks	→	Redis atomic operations
Overselling risk	→	Atomic DECR
Stuck carts	→	30s TTL release
Scalper abuse	→	Bot interception
Spam floods	→	Velocity locking
QR screenshots	→	SETNX one-time scan

See the rush. Control the rush.

NOW, LET'S BREAK IT.

Can the system survive the rush?

CONCURRENT BUY

Can two users buy the last ticket?

BOT ATTACK

Can automated traffic steal inventory?

RAPID-FIRE SPAM

Can 3+ clicks in 5 seconds overwhelm us?

DUPLICATE QR

Can the same ticket enter twice?

LET'S STOP TALKING. → RUN THE SYSTEM.
